Afghanistan Telecom Base Station Hybrid Energy Expansion Project

Overview

The project involved engineering of 450 x 11KW solar + diesel generator hybrid systems to power telecom BTS sites in areas not served by electricity grid. Location: Afghanistan Customer: CaterpillarCan renewable-dominated hybrid standalone systems be implemented in BTS encapsulation telecom sector?

This study presents a thorough techno-economic optimization framework for implementing renewable-dominated hybrid standalone systems for the base transceiver station (BTS) encapsulation telecom sector in Pakistan.

Are hybrid BTS sites good for Pakistan's telecom industry?

Hybrid BTS sites are, therefore, more economical and environmentally friendly regarding worries about global warming and long-term system functioning with no pollution. In conclusion, building improved BTS sites has positive technical, environmental, and financial effects on Pakistan's telecom industry.

What is a Base Transceiver Station (BTS) in Pakistan?

In Pakistan, existing base transceiver stations (BTSs) primarily depend on diesel generators or the conventional grid for power. However, rising international fuel costs pose challenges like load shedding, power outages, and escalating expenses.

Are hybrid power systems a good solution for cities?

A techno-economic study revealed that hybrid systems are the best solution for cities, and these include PV, wind power, diesel, and batteries. Additionally, these minimize CO₂ emissions and ensure pollution-free operation. The power consumed by a BTS load is directly obtained from solar, wind, and DG power.

What is a base transceiver station?

The base transceiver station is one of the main components of cell sites that

consume energy. Diesel fuel purchases for generators, which make up over 80 % of plant-level energy expenditures at off-grid and off-grid tower sites, are the primary source of these costs.

Are hybrid systems viable in autonomous BTS sites?

To address this, this study assessed the viability and sustainability of hybrid systems, focusing on renewable energy, in 42 autonomous BTS sites across north, central, and south Pakistan. Optimization findings show that specific areas in the north are more suitable for solar, wind, biomass, and hydropower.
