Communication base station inverter grid-connected indoor battery

Overview

Can battery energy storage systems improve microgrid performance?

This work was supported by Princess Sumaya University for Technology (Grant (10) 9-2023/2024). The successful integration of battery energy storage systems (BESSs) is crucial for enhancing the resilience and performance of microgrids (MGs) and power systems.

How does active power control work in a Bess inverter?

Step changes in the inverter's reference power show the strategy's quick adaptation to reactive power demands, while maintaining a stable active power supply. Furthermore, active power control disconnects the BESS when it approaches its lower SoC limit in a near-depleted battery scenario.

What is battery energy storage system (BESS)?

Battery energy storage system (BESS) has been applied extensively to provide grid services such as frequency regulation, voltage support, energy arbitrage, etc. Advanced control and optimization algorithms are implemented to meet operational requirements and to preserve battery lifetime.

How to optimize the operation of Bess inverter?

This study introduces a control strategy designed to optimize the operation of BESSs. This control strategy optimizes the BESS operation by dynamically adjusting the inverter's power reference, thereby, extending the battery cycle life.

What is the initial battery charge level for a Bess 2 inverter?

Note that the initial battery charge levels are set to 80% for the first and 50% for the second battery to allow evaluation of the inverter's capability to disconnect a battery as it approaches its lower SoC limit. Figure 9 provides insights into the power output of each BESS and illustrates the moment when BESS 2 is disconnected from the system.

How much power does an inverter use?

Here, both inverters are set to an active power reference of 30 kW and a reactive power reference of 5 kVAR. Note that the initial battery charge levels are set to 80% for the first and 50% for the second battery to allow evaluation of the inverter's capability to disconnect a battery as it approaches its lower SoC limit.
