Communication base stations and communication high voltage

Overview

What is a communication base station?

In the vast telecommunications network, communication base stations play a frontline role. Positioned closest to end users, they serve as gateways for processing customer requests and managing data flow. In the words of "Interesting Communication Engineering Drawings," these stations act like "business trackers," always vigilant to:

How much energy does a communication base station use?

In this region, the communication base stations are equipped with energy storage systems with a rated capacity of 48 kWh and a maximum charge/discharge power of 15.84 kW. The self-discharge efficiency is set at 0.99, and the state of charge (SOC) is allowed to range between a maximum of 0.9 and a minimum of 0.1. Figure 3.

What is a base station connection diagram?

The connection diagram provides a clear overview of how the main base station equipment operates within the network. Surrounding this central "brain" are the "Four Guardians" that ensure seamless functionality: Power Supply: Provides a steady and uninterrupted energy source to keep the equipment operational.

What is the load of a 5G base station?

The load of a 5G base station primarily consists of communication equipment and auxiliary components. The communication equipment mainly includes Active Antenna Unit (AAU) and Base Band Unit (BBU). AAU is a combination of radio frequency unit and antenna array of 5G base station.

What is the difference between a micro base station and a macro base station?

The micro base station serves indoor blind spots with minimal power

consumption. The macro base station exhibits greater potential for demand response. This section primarily analyzes the current mainstream commercial 5G macro base stations. The load of a 5G base station primarily consists of communication equipment and auxiliary components.

How a 5G base station has changed the performance of a base station?

To meet the communication requirements of large capacity and low delay, the commissioning of new equipment has significantly improved the performance of 5G base stations compared with the previous generation base stations. At the same time, the new equipment has altered the power load characteristics of base stations.
