# Energy Storage Project Fire Protection Quote

## Overview

---

Are energy storage systems a fire hazard?

However, like any electrical infrastructure, energy storage systems come with their own set of risks, particularly fire hazards. This is where the National Fire Protection Association (NFPA) 855 comes in. NFPA 855 is a standard that addresses the safety of energy storage systems with a particular focus on fire protection and prevention.

Are energy storage systems safe?

Energy storage systems, while essential for grid stability and renewable energy integration, present unique challenges when it comes to fire safety. Issues like thermal runaway, short circuits, and the flammability of certain materials can result in fires that are difficult to manage due to the stored energy within the system.

What is battery energy storage fire prevention & mitigation?

In 2019, EPRI began the Battery Energy Storage Fire Prevention and Mitigation – Phase I research project, convened a group of experts, and conducted a series of energy storage site surveys and industry workshops to identify critical research and development (R&D) needs regarding battery safety.

What are NFPA 855 requirements for energy storage systems?

**Electrical and Wiring Safety** – Proper electrical wiring and connections are critical for fire safety in energy storage systems. NFPA 855 outlines specific requirements for cable management, grounding, and circuit protection to ensure that electrical components do not pose a fire risk.

Why do we need energy storage systems?

As the demand for clean, renewable energy continues to grow, energy storage systems (ESS) have become a critical component in ensuring a reliable and sustainable energy future. These systems, including batteries and other

storage technologies, allow for the efficient storage of energy generated from sources like solar and wind.

How many MWh of battery energy were involved in the fires?

In total, more than 180 MWh were involved in the fires. For context, Wood Mackenzie, which conducts power and renewable energy research, estimates 17.9 GWh of cumulative battery energy storage capacity was operating globally in that same period, implying that nearly 1 out of every 100 MWh had failed in this way.<sup>1</sup>
