# How many hours can lithium iron phosphate battery store energy

## Overview

---

Depending on the load, a 100Ah LiFePO4 battery can run for 5 days or for 30 minutes. A 2,000W gadget would only last around 30 minutes, but a 20W device might run for almost 50 hours. How long do lithium-iron phosphate batteries last?

Most lithium-iron phosphate batteries are rated for 2,000 to 5,000 charge cycles. That kind of cycle life makes a big difference for anyone relying on consistent, long-term energy storage—whether it's in an RV, solar setup, boat, or home backup system.

How long does a LiFePO4 battery last?

One of the biggest reasons people switch to lithium iron phosphate batteries (LiFePO4) is battery life. While lead acid batteries and AGM options often need replacing every 3 to 5 years, quality LiFePO4 batteries can last up to 10 years or more with proper use and storage.

How long do ionic batteries last?

A Bit of Upkeep Goes a Long Way: Store them properly, check in on them occasionally, and you'll get years of steady performance—whether for solar, RV, marine, or backup use. Ionic deep cycle batteries routinely last 10+ years. What is a LiFePO4 Battery?

A LiFePO4 battery is a rechargeable battery made with lithium iron phosphate.

Do ionic LiFePO4 batteries need maintenance?

Extreme heat or cold while in storage can also mess with the battery's chemistry, so combine a moderate charge level with proper temperature control for best results. Ionic LiFePO4 batteries are truly zero maintenance—no water levels to top off, no corrosion to clean, and no fussing with terminals. Just install them and go.

Are LiFePO4 batteries better than lead-acid batteries?

One big advantage of LiFePO4 batteries over lead-acid is that they can be safely discharged much deeper without damage. While lead-acid batteries start to wear out quickly if discharged below 50%, LiFePO4 batteries can handle up to 100% depth of discharge when needed.

How long does a lithium battery last?

Daily use and regular charging help maintain the battery's chemistry, while letting it sit unused for too long can lead to self-discharge and reduce battery health over time. For example, a 100Ah lithium battery running a 100-watt device could last about 11 to 12 hours on a full charge.
