# How much does 1 watt of solar cost

## Overview

---

Expect the cost per watt to be between \$2 and \$3. As of publishing, the average cost per watt is \$2.84. Most solar companies set the price according to the solar system's wattage. A solar installation's "cost per watt" is a little like the "price per square foot" when you buy a house. How much does a solar system cost per watt?

As of publishing, the average cost per watt is \$2.84. Most solar companies set the price according to the solar system's wattage. A solar installation's "cost per watt" is a little like the "price per square foot" when you buy a house. It helps compare the value of solar energy systems in different sizes.

How many Watts Does a solar panel produce?

Modern panels typically produce 300-450 watts each. Higher-wattage panels cost more per panel but reduce the total number needed, which can actually lower overall installation costs and complexity. It's one of those cases where spending more on equipment can save money on labor and materials.

How much do solar panels cost?

The price of solar panels changes depending on where you live, but the average for installation is just under \$29,000 or \$2.75 per watt. On the high end, we talked to a solar customer in Hawaii who spent \$100,000 going solar. Dion in Nevada said their 10-kW system cost about \$20,000, which is about the national average price for a 7-kW system.

How do you calculate the cost of a solar system?

Solar panel costs are usually measured in the cost per watt of solar installed. However, solar system sizes are measured in kilowatts (kW). To calculate the total price of installing a home solar system, you'll need the system size to be in watts. To convert kilowatts to watts, all you need to do is multiply the system size in kW by 1,000.

What is the relative cost of solar energy?

Another measure of the relative cost of solar energy is its price per kilowatt-hour (kWh). Whereas the price per watt considers the solar system's size, the price per kWh shows the price of the solar system per unit of energy it produces over a given period of time.  $\text{Net cost of the system} / \text{lifetime output} = \text{cost per kilowatt hour}$ .

How much does an 11 kW solar system cost?

The magic number - \$29,360 for an 11 kW system - isn't random. It's based on the average American home using about 11,000 kWh of electricity annually. Your actual needs might be different, but this gives us a solid baseline for comparison. The math behind solar pricing is refreshingly simple:  $\text{System Cost} = \text{System Size (kW)} \times \text{Cost per Watt}$ .
