Outdoor power split type

Overview

What is the difference between a split and a multi-split air conditioner?

With split type air conditioners, indoor and outdoor units are required for each room. This can create problems when there is limited installation space. With the multi-split type, however, a single outdoor unit can power several indoor units. A multi-split system shares its capacity flexibly between the indoor units which are operating.

What is a split system air conditioner?

A split system air conditioner is a great option for keeping your home cool and comfortable in the summer months. These units are also quieter, easier to install, and more energy efficient than central air conditioning.

Can a single outdoor unit power multiple indoor units?

With the multi-split type, however, a single outdoor unit can power several indoor units. A multi-split system shares its capacity flexibly between the indoor units which are operating. This means a smaller capacity system can effectively air condition your entire home while also helping to reduce electricity consumption.

Can a multi-split outdoor unit be connected to an indoor unit?

In most family homes, it is unusual for all indoor units to operate together. This means a single multi-split outdoor unit can easily be connected to indoor units which exceed its rated capacity. In fact, our Super Multi NX can be connected at 162% to 181% of its standard output. The outdoor unit divides capacity between indoor units as needed.

Should I buy a multi-split air conditioner?

Based on these patterns, it is unusual for all indoor units to operate at the same time. In this situation, a multi-split system is the right choice for your home. With split type air conditioners, indoor and outdoor units are required for each room. This can create problems when there is limited installation space.
