# Planning requirements for wind-solar complementary communication base stations

## Overview

---

What are the complementary characteristics of wind and solar energy?

The complementary characteristics of wind and solar energy can be fully utilized, which better aligns with fluctuations in user loads, promoting the integration of wind and solar resources and ensuring the safe and stable operation of the system.

Can a multi-energy complementary power generation system integrate wind and solar energy?

Simulation results validated using real-world data from the southwest region of China. Future research will focus on stochastic modeling and incorporating energy storage systems. This paper proposes constructing a multi-energy complementary power generation system integrating hydropower, wind, and solar energy.

How to integrate wind and solar power?

When considering the integration of wind and solar power, increasing the installed capacity of renewable energy while maintaining a certain wind-solar ratio can effectively match the power generation with the user load within a specific range. In engineering design, it is essential to address the issue of ensuring supply from 16:00 to 22:00.

Do wind and solar power complement each other well?

It is clear that regardless of the wind and solar curtailment rate, the optimal installed capacity ratio is close to 1:1. This indicates that wind power and solar power complement each other well based on typical daily output data selected from the entire year, thereby demonstrating the necessity of simultaneous development of wind and solar power.

What is the maximum integration capacity of wind and solar power?

At this ratio, the maximum wind-solar integration capacity reaches 3938.63

MW, with a curtailment rate of wind and solar power kept below 3 % and a loss of load probability maintained at 0 %. Furthermore, under varying loss of load probabilities, the total integration capacity of wind and solar power increases significantly.

Can clustering analysis be applied to wind and solar power generation?

Clustering analysis can be applied to wind and solar power generation, and scholars have proposed a coordinated optimization scheduling scheme for hydropower, wind, and photovoltaic resources.
