# Solar energy is outside the system

## Overview

---

Solar energy is radiation from the Sun that is capable of producing heat, causing chemical reactions, or generating electricity. The total amount of solar energy incident on Earth is vastly in excess of the world's energy requirements and could satisfy all future energy needs if suitably harnessed.

Solar energy is radiation from the Sun that is capable of producing heat, causing chemical reactions, or generating electricity. The total amount of solar energy incident on Earth is vastly in excess of the world's energy requirements and could satisfy all future energy needs if suitably harnessed.

solar energy, radiation from the Sun capable of producing heat, causing chemical reactions, or generating electricity. The total amount of solar energy incident on Earth is vastly in excess of the world's current and anticipated energy requirements. If suitably harnessed, this highly diffused.

An exoplanet is any planet beyond our solar system. Most of them orbit other stars, but some free-floating exoplanets, called rogue planets, are untethered to any star. We've confirmed more than 6,000 exoplanets, out of the billions that we believe exist. Loading. Loading. Loading. Loading.

The Sun is the major source of energy and vital to life on Earth, but much of its light is reflected. Solar energy acts as a primary energy flow that can be harnessed. [1] Almost all of the Earth's energy input comes from the sun. Not all of the sunlight that strikes the top of the atmosphere is.
