Solar inverter series resistance

Overview

The series resistance of a PV string system is the total electrical combined series resistance from the string ends connecting the inverter /optimiser and the module (s).How to analyze series resistance of solar PV modules?

The methods under consideration are: single slope method, one curve illumination method and mesh analysis. The interpretation of series resistance is done for 18 different solar PV modules containing CdTe, CIGS, mono-crystalline and multi-crystalline silicon modules. The reliability of this method under outdoor operating conditions is also studied.

What causes series resistance in a solar cell?

And i want to add the following: The series resistance in a solar cell has three causes: firstly, the movement of current through the emitter and base of the solar cell; secondly, the contact resistance between the metal contact and the silicon; and finally the resistance of the top and rear metal contacts.

How to determine series resistance & R_s of different PV technologies?

This work presents an analysis of three different methods to determine the series resistance, R_s of different PV technologies and to find the most reliable method under real operating conditions. The methods under consideration are: single slope method, one curve illumination method and mesh analysis.

How do you measure the series resistance of a solar cell?

The method for measuring the series resistance of a solar cell was first proposed by wolf and Rauschenbusch . This involves measuring the characteristic of a cell at two different illuminations.

How does series resistance affect the performance of PV modules?

Introduction The series resistance is one of the most important factors which influence the performance of PV module. A brief introduction to the equations governing the current-voltage characteristics is given in several papers and

it has been found that series resistance influences the FF and power output PV modules [1-3].

What is shunt resistance in silicon solar cell?

In silicon solar cell, R_s is mainly the sum of contact resistance on the front and back surfaces, and Ohmic resistances of the bulk and n^+ (and p^+) diffused layers on the front (and back) sides. Shunt resistance can arise from imperfections on the device surface and in the bulk as well as from leakage currents across the edge of the cell [1, 2].
