Capital costs tend to be low for gas and oil power stations; moderate for onshore wind turbines and solar PV (photovoltaics); higher for coal plants and higher still for waste-to-energy, wave and tidal, solar thermal, offshore wind and nuclear.

To get to the bottom of which form of energy is the cheapest, CBS News analyzed the cost to produce coal, gas, nuclear, wind and solar energy, including the impact of tax incentives, tariffs and other factors. Multiple criteria come into play in trying to assess the cheapest form of energy. These.

The average cost per unit of energy generated across the lifetime of a new power plant. This data is expressed in US dollars per kilowatt-hour. It is adjusted for inflation but does not account for differences in living costs between countries. How have things changed?

When will countries phase out.
